# Agenda

---

Brief Introduction to WebRTC

How WebRTC Works

Adapting to Native Platforms

Tools and Resources

Look at Some Code

# Resources

---

Finished source: <https://github.com/SuavePirate/Xamarin.WebRTC>

WebRTC docs: <https://webrtc.org>

IceLink docs: <http://docs.frozenmountain.com/icelink2/>

Native libraries: <https://webrtc.org/native-code/native-apis/>

# What is Web RTC

---

# The Basics of WebRTC

---

Web Real-Time-Communication

New(ish) open-sourced standard for transmitting data from one peer to another

A set of frameworks and tools for creating connections and sending data

Data transmitted over peer-to-peer connections

Agnostic to types of data sent

- Audio buffers
- Video frames
- Raw data
- Files

# Important Components and Terms

---

Peer Connections – the actual connection between two clients

# Important Components and Terms

---

Peer Connections – the actual connection between two clients

STUN - Session Traversal of User Datagram Protocol [UDP] Through Network Address Translators [NATs]

# Important Components and Terms

---

Peer Connections – the actual connection between two clients

STUN - Session Traversal of User Datagram Protocol [UDP] Through Network Address Translators [NATs]

TURN – Traversal Using Relays around NAT

# Important Components and Terms

---

Peer Connections – the actual connection between two clients

STUN - Session Traversal of User Datagram Protocol [UDP] Through Network Address Translators [NATs]

TURN – Traversal Using Relays around NAT

ICE - Interactive Connectivity Establishment

Vanilla Ice

# Important Components and Terms

---

Peer Connections – the actual connection between two clients

STUN - Session Traversal of User Datagram Protocol [UDP] Through Network Address Translators [NATs]

TURN – Traversal Using Relays around NAT

ICE - Interactive Connectivity Establishment

Signaling – a means of communicating connection info between clients

# Important Components and Terms

---

Peer Connections – the actual connection between two clients

STUN - Session Traversal of User Datagram Protocol [UDP] Through Network Address Translators [NATs]

TURN – Traversal Using Relays around NAT

ICE - Interactive Connectivity Establishment

Signaling – a means of communicating connection info between clients

## Codecs

- Video
  - VP8
- Audio
  - Opus

# Making Peer Connections

---

# Creating a P2P Connection via STUN

# Creating a P2P Connection via STUN

---

Covers most scenarios

Fails when peers have 2 incompatible NAT types or peers run through heavy firewalls

# Creating a P2P Connection via STUN + TURN

# Creating a P2P Connection via STUN + TURN

---

TURN server relays data between two peers

Means no direct peer connection is made

Can have performance implications

Can be expensive

Covers 99.999% of cases

# Multi-connection Mesh Model

---

Each client creates a connection to every other client

Can create unreliable connections

Individual connections can be dropped without dropping them all

Requires extended signaling and accountability

# Multi-connection Mixer Model

---

Each client connects to a single server

The server mixes audio and video streams per peer

The server relays the mixed streams to each peer

Heavy lifting put on server rather than distributed

Expensive

Hard to scale

# Using a Connection

---

# Sending Audio and Video Data

---

## getUserMedia

- Gets access to device hardware (mic and camera)

# Sending Audio and Video Data

---

## getUserMedia

- Gets access to device hardware (mic and camera)

## Encode the media

- Pick a codec
- Encode the data with that codec

# Sending Audio and Video Data

---

## getUserMedia

- Gets access to device hardware (mic and camera)

## Encode the media

- Pick a codec
- Encode the data with that codec

## Send encoded media over connection

# Sending Audio and Video Data

---

## getUserMedia

- Gets access to device hardware (mic and camera)

## Encode the media

- Pick a codec
- Encode the data with that codec

## Send encoded media over connection

## Switch media sources (switch camera, switch mic)

# Advanced Functionality

---

Screen streaming

Multi-source streaming

- Streaming multiple video streams from one client
- Streaming multiple audio streams from one client

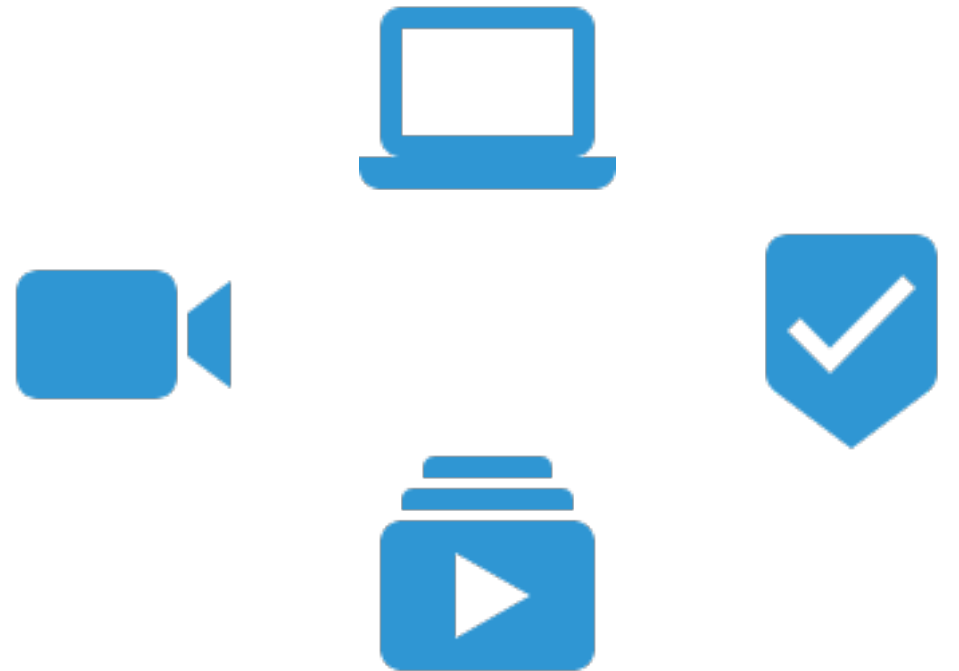

Audio Mixing

Non-TURN relaying

Recording streams

Distributed streaming

Stream signatures

# Going Cross-Platform

---

# Platforms Supported

Web\*

Windows

- WPF
- Windows Forms
- Win8
- UWP\*

Windows Phone

- 8.0 Silverlight+
- 8.1 RT\*

Android

iOS

Mac

APPLE

FIREFOX

CHROME

EXPLORER

WINDOWS

XAMARIN

EDGE

JAVA

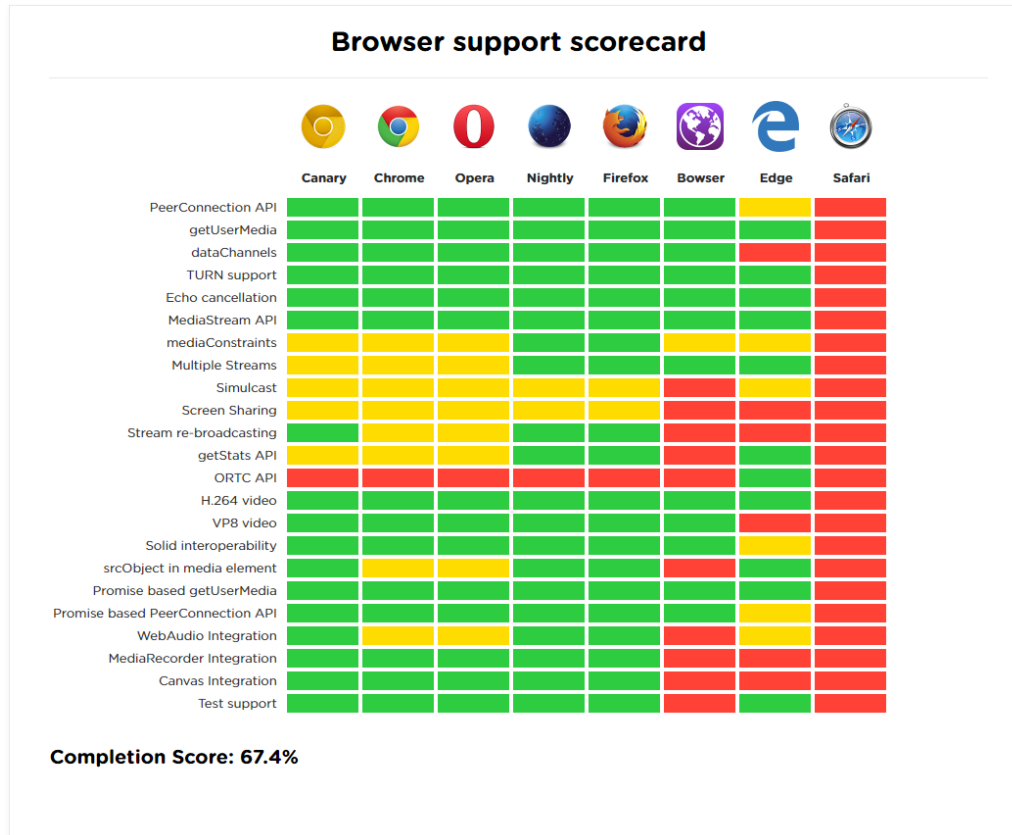

ANDROID

SAFARI

# Web Support

# Browser support scorecard

								
	Canary	Chrome	Opera	Nightly	Firefox	Bowser	Edge	Safari
PeerConnection API	Green	Green	Green	Green	Green	Green	Yellow	Red
getUserMedia	Green	Green	Green	Green	Green	Green	Green	Red
dataChannels	Green	Green	Green	Green	Green	Green	Red	Red
TURN support	Green	Green	Green	Green	Green	Green	Green	Red
Echo cancellation	Green	Green	Green	Green	Green	Green	Green	Red
MediaStream API	Green	Green	Green	Green	Green	Green	Green	Red
mediaConstraints	Yellow	Yellow	Yellow	Green	Green	Yellow	Yellow	Red
Multiple Streams	Yellow	Yellow	Yellow	Green	Green	Green	Green	Red
Simulcast	Yellow	Yellow	Yellow	Yellow	Yellow	Red	Yellow	Red
Screen Sharing	Yellow	Yellow	Yellow	Yellow	Yellow	Red	Red	Red
Stream re-broadcasting	Green	Yellow	Yellow	Green	Green	Red	Red	Red
getStats API	Yellow	Yellow	Yellow	Green	Green	Red	Green	Red
ORTC API	Red	Red	Red	Red	Red	Red	Green	Red
H.264 video	Green	Green	Green	Green	Green	Green	Green	Red
VP8 video	Green	Green	Green	Green	Green	Green	Red	Red
Solid interoperability	Green	Green	Green	Green	Green	Green	Yellow	Red
srcObject in media element	Green	Yellow	Yellow	Green	Green	Red	Green	Red
Promise based getUserMedia	Green	Green	Green	Green	Green	Green	Green	Red
Promise based PeerConnection API	Green	Green	Green	Green	Green	Green	Yellow	Red
WebAudio Integration	Green	Yellow	Yellow	Green	Green	Red	Yellow	Red
MediaRecorder Integration	Green	Green	Green	Green	Green	Red	Red	Red
Canvas Integration	Green	Green	Green	Green	Green	Red	Red	Red
Test support	Green	Green	Green	Green	Green	Red	Green	Red

**Completion Score: 67.4%**

# Web Workarounds

---

Npapi plugins

Chrome + Firefox extensions

ActiveX plugins

Java Applet plugins

Still doesn't catch all

- Edge does not support WebRTC (they are pushing ORTC)
- Edge does not support ActiveX plugins, Java Applets, or npapi

# Native Platform Support and Issues

---

WebRTC is built on an open sourced C++ platform-agnostic framework

- You theoretically can run it anywhere!

Not every platform supports given codecs

VP8 is not native to any Windows SDK!

We need to get a custom build of the native VP8 (C++) codec

Compile the VP8 codec against Visual C++ per platform

Same with Opus

Unlike web browsers that ship with VP8 and Opus codecs as part of the application, we need to include the libraries separately

# Building

---

## Windows

- Build VP8 codec
- Build Opus codec
- Wrap calls to C++ library

WINDOWS

## Android

- Include reference to native codecs built into OS

ANDROID

APPLE

## iOS + Mac

- Add official libraries for native codecs

## Xamarin

- Add bindings to native libraries for codecs and wrap calls

XAMARIN

# IceLink

---

A library and framework wrapping a lot of native WebRTC

Languages and platforms supported

- Android
- iOS
- Windows (WinForms, WPF, Win8, UWP)
- Windows Phone (8, 8.1)
- Web
  - ActiveX control
  - Java Applet
  - Npapi in the works
- Mac
- Xamarin (Android, iOS, Mac)
- Java

# Demo

---
